

Package ‘asa’

January 11, 2026

Title AI Search Agent for Large-Scale Research Automation

Version 0.1.0

Author Connor Jerzak [aut, cre] (<<https://orcid.org/0000-0003-1914-8905>>)

Maintainer Connor Jerzak <connor.jerzak@gmail.com>

Description Provides an LLM-powered research agent for performing AI search tasks at large scales. Uses a ReAct (Reasoning + Acting) agent pattern with web search capabilities via DuckDuckGo and Wikipedia. Implements DeepAgent-style memory folding for context management. The agent is built on 'LangGraph' and supports multiple LLM backends including 'OpenAI', 'Groq', and 'xAI'.

Description

The asa package provides an LLM-powered research agent for performing AI search tasks at large scales using web search capabilities.

The agent uses a ReAct (Reasoning + Acting) pattern implemented via LangGraph, with tools for searching DuckDuckGo and Wikipedia. It supports multiple LLM backends (OpenAI, Groq, xAI) and implements DeepAgent-style memory folding for managing long conversations.

Main Functions

- `build_backend`: Set up the Python conda environment
- `initialize_agent`: Initialize the search agent
- `run_task`: Run a structured task with the agent
- `run_task_batch`: Run multiple tasks in batch

Configuration

The package requires a Python environment with LangChain and related packages. Use `build_backend` to create this environment automatically.

For anonymous searching, the package can use Tor as a SOCKS5 proxy. Install Tor via `brew install tor` (macOS) and start it with `brew services start tor`.

`.acquire_rate_limit_token`

Acquire a Rate Limit Token (Proactive Rate Limiting)

Description

Acquires a token from the rate limiter bucket before making a request. If no tokens are available, waits until one becomes available. This is called BEFORE making requests to prevent rate limit errors. Wait times are humanized with random jitter when ASA_HUMANIZE_TIMING is TRUE.

Usage

```
.acquire_rate_limit_token(verbose = FALSE)
```

Arguments

verbose	Print waiting message if TRUE
---------	-------------------------------

`.adaptive_rate_get_multiplier`

7

Value

The wait time in seconds (0 if no wait was needed)

`.adaptive_rate_get_multiplier`

Get Current Adaptive Rate Multiplier

Description

Returns the current delay multiplier for use in rate limiting calculations.

Usage

`.adaptive_rate_get_multiplier()`

Value

Numeric multiplier (1.0 = normal, >1 = slower, <1 = faster)

`.adaptive_rate_init` *Initialize Adaptive Rate Limiting State*

Description

Sets up the adaptive rate limiting state in asa_env. Called during agent initialization.

Usage

`.adaptive_rate_init()`

Value

Invisibly returns NULL

.adaptive_rate_record *Record Result for Adaptive Rate Limiting*

Description

Records a success or error result and adjusts the delay multiplier accordingly. Tracks a sliding window of recent results to determine adaptation.

Usage

```
.adaptive_rate_record(status, verbose = FALSE)
```

Arguments

status	One of "success", "captcha", "blocked", or "error"
verbose	If TRUE, prints adjustment messages

Value

Invisibly returns the current multiplier

.adaptive_rate_reset *Reset Adaptive Rate Limiting*

Description

Resets the adaptive rate limiting state to defaults.

Usage

```
.adaptive_rate_reset()
```

Value

Invisibly returns NULL

.adaptive_rate_status *Get Adaptive Rate Status*

Description

Returns the current state of adaptive rate limiting for monitoring.

Usage

```
.adaptive_rate_status()
```

Value

List with multiplier, success_streak, recent_count, and enabled status

.asa_option *Get Package Option or Default*

Description

Returns the value of an asa package option, or the default if not set. Options can be set via options(asap.option_name = value).

Usage

```
.asa_option(name, default)
```

Arguments

name	Option name (without "asa." prefix)
default	Default value if option not set

Value

Option value or default

.augment_prompt_temporal
 Augment Prompt with Temporal Context

Description

Adds temporal date hints to the prompt when after/before dates are specified. This helps guide the agent to search for time-relevant information.

Usage

```
.augment_prompt_temporal(prompt, temporal, verbose = FALSE)
```

Arguments

prompt	Original prompt
temporal	Temporal filtering list (may be NULL)

Value

Augmented prompt string

<code>.build_trace</code>	<i>Build Trace from Raw Response</i>
---------------------------	--------------------------------------

Description

Build Trace from Raw Response

Usage

```
.build_trace(raw_response)
```

<code>.circuit_breaker_check</code>	<i>Check Circuit Breaker State</i>
-------------------------------------	------------------------------------

Description

Checks if the circuit breaker is tripped. If cooldown has passed, automatically resets the breaker.

Usage

```
.circuit_breaker_check(verbose = FALSE)
```

Arguments

<code>verbose</code>	Print message when breaker resets
----------------------	-----------------------------------

Value

TRUE if requests can proceed, FALSE if breaker is tripped

<code>.circuit_breaker_init</code>	<i>Initialize Circuit Breaker</i>
------------------------------------	-----------------------------------

Description

Initializes the circuit breaker in asa_env. Called automatically before batch operations if circuit_breaker=TRUE.

Usage

```
.circuit_breaker_init()
```

Value

Invisibly returns NULL

.circuit_breaker_record

Record Result in Circuit Breaker

Description

Records a success or error in the circuit breaker's sliding window. If error rate exceeds threshold, trips the breaker.

Usage

```
.circuit_breaker_record(status, verbose = FALSE)
```

Arguments

status	Either "success" or "error"
verbose	Print message when breaker trips

Value

Invisibly returns whether breaker is now tripped

.circuit_breaker_status

Get Circuit Breaker Status

Description

Returns the current state of the circuit breaker for monitoring.

Usage

```
.circuit_breaker_status()
```

Value

List with tripped, error_rate, recent_count, and trip_count

`.close_http_clients` *Close HTTP Clients*

Description

Safely closes the synchronous httpx client to prevent resource leaks. This is called automatically by `reset_agent()` and when reinitializing.

Usage

```
.close_http_clients()
```

Details

Note: We no longer create or manage async clients from R (R-CRIT-001 fix). LangChain manages its own async client lifecycle internally.

Value

Invisibly returns NULL

`.create_agent` *Create the LangGraph Agent*

Description

Create the LangGraph Agent

Usage

```
.create_agent(  
  llm,  
  tools,  
  use_memory_folding,  
  memory_threshold,  
  memory_keep_recent  
)
```

Arguments

<code>llm</code>	LLM instance
<code>tools</code>	List of tools
<code>use_memory_folding</code>	Whether to use memory folding
<code>memory_threshold</code>	Messages before folding
<code>memory_keep_recent</code>	Messages to keep

`.create_http_clients` *Create HTTP Clients for API Calls*

Description

Creates two synchronous httpx clients: one direct (no proxy) for LLM API calls, and one proxied (with Tor) for search tools. This dual-client approach ensures OpenAI/OpenRouter API calls don't route through Tor (which causes failures), while DuckDuckGo searches still use Tor to avoid IP blocks.

Usage

```
.create_http_clients(search_proxy, timeout)
```

Arguments

search_proxy	Proxy URL for search tools (e.g., Tor SOCKS5) or NULL
timeout	Timeout in seconds

Details

Note: We intentionally do NOT create async clients. LangChain/OpenAI SDK creates its own async client internally when needed (for async operations). This avoids R-CRIT-001 where async client cleanup was unreliable from R since aclose() requires an async context.

Value

A list with 'direct' client (no proxy, for LLM) and 'proxied' client (for search)

`.create_llm` *Create LLM Instance*

Description

Create LLM Instance

Usage

```
.create_llm(backend, model, clients, rate_limit)
```

Arguments

backend	Backend name
model	Model identifier
clients	HTTP clients (for OpenAI)
rate_limit	Requests per second

```
.create_research_config  
Create Research Configuration
```

Description

Create Research Configuration

Usage

```
.create_research_config(  
    workers,  
    max_rounds,  
    budget,  
    stop_policy,  
    sources,  
    temporal = NULL  
)
```

```
.create_research_graph  
Create Research Graph
```

Description

Create Research Graph

Usage

```
.create_research_graph(agent, config_dict)
```

```
.create_tools          Create Search Tools
```

Description

Create Search Tools

Usage

```
.create_tools(proxy)
```

Arguments

proxy	Proxy URL or NULL
-------	-------------------

`.extract_fields` *Extract Specific Fields from Response*

Description

Extract Specific Fields from Response

Usage

`.extract_fields(text, fields)`

Arguments

<code>text</code>	Response text
<code>fields</code>	Character vector of field names to extract

`.extract_json_from_trace` *Extract JSON from Agent Traces*

Description

Internal function to extract JSON data from raw agent traces.

Usage

`.extract_json_from_trace(text)`

Arguments

<code>text</code>	Raw trace text
-------------------	----------------

Value

Parsed JSON data as a list, or NULL if no JSON found

`.extract_json_object` *Extract JSON Object from Text*

Description

Extract JSON Object from Text

Usage

`.extract_json_object(text, start = NULL)`

Arguments

<code>text</code>	Response text
<code>start</code>	Optional 1-based start index for extraction

```
.extract_response_text
```

Extract Response Text from Raw Response

Description

Extract Response Text from Raw Response

Usage

```
.extract_response_text(raw_response, backend)
```

```
.extract_search_tier
```

Extract Search Tier from Response Trace

Description

Parses the agent's response trace to determine which search tier was used (PRIMP, Selenium, DDGS, or Requests). This is useful for assessing result quality since higher tiers generally produce more reliable results.

Usage

```
.extract_search_tier(trace)
```

Arguments

trace Character string containing the agent's execution trace

Value

Character string: "primp", "selenium", "ddgs", "requests", or "unknown"

```
.get_default_backend
```

Get Default Backend

Description

Get Default Backend

Usage

```
.get_default_backend()
```

.get_default_conda_env

Get Default Conda Environment

Description

Get Default Conda Environment

Usage

.get_default_conda_env()

.get_default_model

Get Default Model

Description

Get Default Model

Usage

.get_default_model()

.get_default_workers

Get Default Workers

Description

Get Default Workers

Usage

.get_default_workers()

`.get_extdata_path` *Get External Data Path*

Description

Returns the path to the package's external data directory.

Usage

`.get_extdata_path(filename = NULL)`

Arguments

`filename` Optional filename within extdata directory

Value

Character string with the path

`.get_local_ip` *Get Local IP Address (Cross-Platform)*

Description

Returns the local IP address for use with Exo backend. Works on Windows, macOS, and Linux.

Usage

`.get_local_ip()`

Value

Character string with the local IP address, or "127.0.0.1" on failure.

`.get_python_path` *Get Package Python Module Path*

Description

Returns the path to the Python modules shipped with the package.

Usage

`.get_python_path()`

Value

Character string with the path to inst/python

.handle_response_issues

Handle Response Issues (Rate Limiting, Timeouts)

Description

Handle Response Issues (Rate Limiting, Timeouts)

Usage

.handle_response_issues(trace, verbose)

.humanize_delay

Generate a Delay That Feels Human

Description

Not uniform jitter. This models the messy, inefficient pause between intention and action - the entropy of a tired hand:

- Log-normal base: most actions quick, occasional long pauses (thinking)
- Micro-stutters: tiny random additions (the tremor of uncertainty)
- Fatigue curve: delays drift longer as session ages
- Occasional spikes: the pause of a mind changing

Usage

.humanize_delay(base_delay, enabled = NULL)

Arguments

base_delay The nominal delay in seconds

enabled Whether humanized timing is enabled (default from constants)

Value

A delay that breathes like a human

```
.import_python_module Import Python Module into asa_env
```

Description

Generic helper for importing Python modules from inst/python. Handles caching, path resolution, and error handling.

Usage

```
.import_python_module(module_name, env_name = module_name, required = TRUE)
```

Arguments

module_name	Name of the Python module (without .py)
env_name	Name in asa_env (defaults to module_name)
required	If TRUE, error on failure; if FALSE, return NULL

Value

The imported Python module (invisibly), or NULL on failure if not required

```
.import_python_packages  
      Import Required Python Packages
```

Description

Import Required Python Packages

Usage

```
.import_python_packages()
```

```
.import_research_modules  
      Import Research Python Modules
```

Description

Import Research Python Modules

Usage

```
.import_research_modules()
```

.invoke_memory_folding_agent
 Invoke Memory Folding Agent

Description

Invoke Memory Folding Agent

Usage

```
.invoke_memory_folding_agent(  
    python_agent,  
    prompt,  
    recursion_limit,  
    thread_id = NULL  
)
```

.invoke_standard_agent
 Invoke Standard Agent

Description

Invoke Standard Agent

Usage

```
.invoke_standard_agent(python_agent, prompt, recursion_limit, thread_id = NULL)
```

.is_initialized *Check if ASA Agent is Initialized*

Description

Check if ASA Agent is Initialized

Usage

```
.is_initialized()
```

Value

Logical indicating if the agent has been initialized

```
.normalize_schema      Normalize Schema Input
```

Description

Normalize Schema Input

Usage

```
.normalize_schema(schema, query, verbose)
```

```
.parse_json_response  Parse JSON Response
```

Description

Parse JSON Response

Usage

```
.parse_json_response(response_text)
```

Arguments

response_text Response text from agent

```
.process_research_results  
Process Research Results
```

Description

Process Research Results

Usage

```
.process_research_results(result, schema_dict, include_provenance)
```

.rate_limiter_init *Initialize Rate Limiter*

Description

Initializes the token bucket rate limiter in asa_env. Called automatically on first use if not already initialized.

Usage

```
.rate_limiter_init(rate = NULL, bucket_size = NULL)
```

Arguments

rate	Requests per second (tokens refill rate)
bucket_size	Maximum tokens in bucket

Value

Invisibly returns NULL

.rate_limiter_reset *Reset Rate Limiter*

Description

Resets the rate limiter to full capacity. Useful after errors or when starting a new batch of requests.

Usage

```
.rate_limiter_reset()
```

Value

Invisibly returns NULL

```
.register_cleanup_finalizer
```

Register Session Finalizer for HTTP Client Cleanup

Description

Registers a finalizer that will clean up HTTP clients when the R session ends or the package environment is garbage collected. This provides an additional safety net beyond `.onUnload` for resource leak prevention.

Usage

```
.register_cleanup_finalizer()
```

Value

Invisibly returns NULL

```
.resume_research
```

Resume Research from Checkpoint

Description

Resume Research from Checkpoint

Usage

```
.resume_research(checkpoint_file, verbose)
```

```
.run_agent
```

Run the ASA Agent (Internal)

Description

Internal function that invokes the search agent with a prompt. Users should use `run_task` instead.

Usage

```
.run_agent(
  prompt,
  agent = NULL,
  temporal = NULL,
  recursion_limit = NULL,
  thread_id = NULL,
  verbose = FALSE
)
```

Arguments

<code>prompt</code>	The prompt to send to the agent
<code>agent</code>	An <code>asa_agent</code> object
<code>temporal</code>	Named list for temporal filtering
<code>recursion_limit</code>	Maximum number of agent steps
<code>verbose</code>	Print status messages

Value

An object of class `asa_response`

```
.run_research
```

Run Research (Non-Streaming)

Description

Run Research (Non-Streaming)

Usage

```
.run_research(graph, query, schema_dict, config_dict)
```

```
.run_research_with_progress
```

Run Research with Progress Updates

Description

Run Research with Progress Updates

Usage

```
.run_research_with_progress(  
    graph,  
    query,  
    schema_dict,  
    config_dict,  
    checkpoint_file,  
    verbose  
)
```

`.save_checkpoint` *Save Checkpoint*

Description

Save Checkpoint

Usage

```
.save_checkpoint(result, query, schema_dict, config_dict, checkpoint_file)
```

`.stop_validation` *Stop with Formatted Validation Error*

Description

Creates a standardized error message with Got/Fix sections.

Usage

```
.stop_validation(param_name, requirement, actual = NULL, fix = NULL)
```

Arguments

<code>param_name</code>	Name of the parameter that failed validation
<code>requirement</code>	What the parameter should be
<code>actual</code>	What was actually received (optional, auto-formatted)
<code>fix</code>	Actionable fix suggestion

`.validate_api_key` *Validate API Key for Backend*

Description

Checks that the required API key environment variable is set for the specified backend. Throws an informative error if missing.

Usage

```
.validate_api_key(backend)
```

Arguments

<code>backend</code>	LLM backend name
----------------------	------------------

Value

Invisibly returns TRUE if valid

.validate_asa_agent *Validate S3 Constructor: asa_agent*

Description

Validate S3 Constructor: asa_agent

Usage

```
.validate_asa_agent(python_agent, backend, model, config)
```

.validate_asa_response
 Validate S3 Constructor: asa_response

Description

Validate S3 Constructor: asa_response

Usage

```
.validate_asa_response(  
    message,  
    status_code,  
    raw_response,  
    trace,  
    elapsed_time,  
    fold_count,  
    prompt  
)
```

.validate_asa_result *Validate S3 Constructor: asa_result*

Description

Validate S3 Constructor: asa_result

Usage

```
.validate_asa_result(prompt, message, parsed, raw_output, elapsed_time, status)
```

```
.validate_build_backend
```

Validate build_backend() Parameters

Description

Validate build_backend() Parameters

Usage

```
.validate_build_backend(conda_env, conda, python_version)
```

```
.validate_build_prompt
```

Validate build_prompt() Parameters

Description

Validate build_prompt() Parameters

Usage

```
.validate_build_prompt(template)
```

```
.validate_choice
```

Validate Choice from Set

Description

Validate Choice from Set

Usage

```
.validate_choice(x, param_name, choices)
```

Arguments

x Value to check

param_name Name for error message

choices Valid choices

.validate_conda_env *Validate Conda Environment Name*

Description

Validate Conda Environment Name

Usage

```
.validate_conda_env(x, param_name)
```

Arguments

x	Value to check
param_name	Name for error message

.validate_configure_search
 Validate configure_search() Parameters

Description

Validate configure_search() Parameters

Usage

```
.validate_configure_search(  
    max_results,  
    timeout,  
    max_retries,  
    retry_delay,  
    backoff_multiplier,  
    captcha_backoff_base,  
    page_load_wait,  
    inter_search_delay,  
    conda_env  
)
```

```
.validate_configure_tor_registry
    Validate configure_tor_registry() Parameters
```

Description

Validate configure_tor_registry() Parameters

Usage

```
.validate_configure_tor_registry(
    registry_path,
    enable,
    bad_ttl,
    good_ttl,
    overuse_threshold,
    overuse_decay,
    max_rotation_attempts,
    ip_cache_ttl,
    conda_env
)
```

```
.validate_consistency  Validate Logical Consistency Between Parameters
```

Description

Validate Logical Consistency Between Parameters

Usage

```
.validate_consistency(condition, message, fix)
```

Arguments

condition	Condition that must be TRUE
message	Error message if condition is FALSE
fix	How to fix the issue

.validate_dataframe *Validate Data Frame with Required Columns*

Description

Validate Data Frame with Required Columns

Usage

```
.validate_dataframe(x, param_name, required_cols = NULL)
```

Arguments

x	Value to check
param_name	Name for error message
required_cols	Required column names (optional)

.validate_initialize_agent
 Validate initialize_agent() Parameters

Description

Validate initialize_agent() Parameters

Usage

```
.validate_initialize_agent(  
  backend,  
  model,  
  conda_env,  
  proxy,  
  use_memory_folding,  
  memory_threshold,  
  memory_keep_recent,  
  rate_limit,  
  timeout,  
  verbose,  
  tor = NULL  
)
```

`.validate_json_schema` *Validate JSON Against Expected Schema*

Description

Validates that parsed JSON contains all expected fields. Returns a structured validation result indicating success or failure.

Usage

```
.validate_json_schema(parsed, expected_fields)
```

Arguments

<code>parsed</code>	The parsed JSON object (list or NULL)
<code>expected_fields</code>	Character vector of expected field names

Value

A list with: valid (logical), reason (character), missing (character vector)

`.validate_logical` *Validate Boolean*

Description

Validate Boolean

Usage

```
.validate_logical(x, param_name)
```

Arguments

<code>x</code>	Value to check
<code>param_name</code>	Name for error message

.validate_positive *Validate Positive Number*

Description

Validate Positive Number

Usage

```
.validate_positive(x, param_name, allow_zero = FALSE, integer_only = FALSE)
```

Arguments

x	Value to check
param_name	Name for error message
allow_zero	Allow zero values (default: FALSE)
integer_only	Require integer values (default: FALSE)

.validate_process_outputs *Validate process_outputs() Parameters*

Description

Validate process_outputs() Parameters

Usage

```
.validate_process_outputs(df, parallel, workers)
```

.validate_proxy_url *Validate URL Format (SOCKS5 Proxy)*

Description

Validate URL Format (SOCKS5 Proxy)

Usage

```
.validate_proxy_url(x, param_name)
```

Arguments

x	Value to check (NULL is valid = no proxy)
param_name	Name for error message

`.validate_range` *Validate Range*

Description

Validate Range

Usage

```
.validate_range(x, param_name, min = NULL, max = NULL)
```

Arguments

x	Value to check (must already be validated as numeric)
param_name	Name for error message
min	Minimum allowed value (optional)
max	Maximum allowed value (optional)

`.validate_required` *Validate Required Argument Presence*

Description

Validate Required Argument Presence

Usage

```
.validate_required(x, param_name)
```

Arguments

x	Value to check
param_name	Name for error message

```
.validate_research_inputs
```

Validate Research Inputs

Description

Validate Research Inputs

Usage

```
.validate_research_inputs(  
    query,  
    schema,  
    output,  
    workers,  
    max_rounds,  
    budget,  
    stop_policy,  
    sources,  
    checkpoint_dir,  
    resume_from  
)
```

```
.validate_run_agent      Validate run_agent() Parameters
```

Description

Validate run_agent() Parameters

Usage

```
.validate_run_agent(prompt, agent, recursion_limit, verbose, thread_id = NULL)
```

```
.validate_run_task       Validate run_task() Parameters
```

Description

Validate run_task() Parameters

Usage

```
.validate_run_task(prompt, output_format, agent, verbose, thread_id = NULL)
```

```
.validate_run_task_batch  
    Validate run_task_batch() Parameters
```

Description

Validate run_task_batch() Parameters

Usage

```
.validate_run_task_batch(  
    prompts,  
    output_format,  
    agent,  
    parallel,  
    workers,  
    progress  
)
```

```
.validate_s3_class      Validate S3 Class
```

Description

Validate S3 Class

Usage

```
.validate_s3_class(x, param_name, expected_class)
```

Arguments

x	Value to check
param_name	Name for error message
expected_class	Expected S3 class name

`.validate_string` *Validate Non-Empty String*

Description

Validate Non-Empty String

Usage

```
.validate_string(x, param_name, allow_empty = FALSE, allow_na = FALSE)
```

Arguments

<code>x</code>	Value to check
<code>param_name</code>	Name for error message
<code>allow_empty</code>	Allow empty strings (default: FALSE)
<code>allow_na</code>	Allow NA values (default: FALSE)

`.validate_string_vector` *Validate Character Vector (Non-Empty)*

Description

Validate Character Vector (Non-Empty)

Usage

```
.validate_string_vector(x, param_name, min_length = 1L)
```

Arguments

<code>x</code>	Value to check
<code>param_name</code>	Name for error message
<code>min_length</code>	Minimum required length (default: 1)

`.validate_temporal` *Validate Temporal Filtering Parameters*

Description

Validates and normalizes temporal filtering parameters used by `run_task()` and `asa_enumerate()`. Returns a normalized list or NULL if input is NULL.

Usage

```
.validate_temporal(temporal, param_name = "temporal")
```

Arguments

<code>temporal</code>	Named list with temporal filtering options, or NULL
<code>param_name</code>	Name for error messages (default: "temporal")

Value

Normalized temporal list or NULL

`.validate_tor_options` *Validate tor_options() Parameters*

Description

Validate `tor_options()` Parameters

Usage

```
.validate_tor_options(tor, param_name = "tor")
```

`.with_search_config` *Apply Search Configuration for a Single Operation*

Description

Internal helper that applies search settings, runs a function, and restores the original configuration afterward.

Usage

```
.with_search_config(search, conda_env = "asa_env", fn)
```

Arguments

<code>search</code>	asa_search object or list of search settings
<code>conda_env</code>	Conda env used by search tools
<code>fn</code>	Function to run with search config applied

Value

Result of fn()

`.with_temporal`

Apply Temporal Filtering for a Single Operation

Description

Internal helper that applies temporal filtering, runs a function, and restores the original setting. Used by run_task() and run_task_batch().

Usage

```
.with_temporal(temporal, fn)
```

Arguments

temporal	Named list with temporal options (time_filter, after, before)
fn	Function to run with temporal filtering applied

Value

Result of fn()

`as.data.frame.asa_audit_result`

Convert asa_audit_result to Data Frame

Description

Convert asa_audit_result to Data Frame

Usage

```
## S3 method for class 'asa_audit_result'  
as.data.frame(x, ...)
```

Arguments

x	An asa_audit_result object
...	Additional arguments (ignored)

Value

The audited data.frame with audit columns

```
as.data.frame.asa_enumerate_result  
Convert asa_enumerate_result to Data Frame
```

Description

Convert asa_enumerate_result to Data Frame

Usage

```
## S3 method for class 'asa_enumerate_result'  
as.data.frame(x, ...)
```

Arguments

x	An asa_enumerate_result object
...	Additional arguments (ignored)

Value

The data data.frame from the result

```
as.data.frame.asa_result  
Convert asa_result to Data Frame
```

Description

Convert asa_result to Data Frame

Usage

```
## S3 method for class 'asa_result'  
as.data.frame(x, ...)
```

Arguments

x	An asa_result object
...	Additional arguments (ignored)

Value

A single-row data frame

ASA_ADAPTIVE_RATE_DECREASE

Adaptive Rate Decrease Factor (on success streak)

Description

Multiply delays by this factor after 10 consecutive successes.

Usage

ASA_ADAPTIVE_RATE_DECREASE

Format

An object of class `numeric` of length 1.

ASA_ADAPTIVE_RATE_ENABLED

Enable Adaptive Rate Limiting

Description

When TRUE, dynamically adjust delays based on success/error patterns.

Usage

ASA_ADAPTIVE_RATE_ENABLED

Format

An object of class `logical` of length 1.

ASA_ADAPTIVE_RATE_INCREASE

Adaptive Rate Increase Factor (on error)

Description

Multiply delays by this factor when CAPTCHA/block detected.

Usage

ASA_ADAPTIVE_RATE_INCREASE

Format

An object of class `numeric` of length 1.

ASA_ADAPTIVE_RATE_MAX *Adaptive Rate Maximum Multiplier*

Description

Cap on delay multiplier to prevent excessive slowdown.

Usage

ASA_ADAPTIVE_RATE_MAX

Format

An object of class `numeric` of length 1.

ASA_ADAPTIVE_RATE_MIN *Adaptive Rate Minimum Multiplier*

Description

Floor on delay multiplier to maintain some speed.

Usage

ASA_ADAPTIVE_RATE_MIN

Format

An object of class `numeric` of length 1.

ASA_ADAPTIVE_RATE_WINDOW
Adaptive Rate Window Size (requests)

Description

Number of recent requests to consider for adaptive rate adjustment.

Usage

ASA_ADAPTIVE_RATE_WINDOW

Format

An object of class `integer` of length 1.

asa_agent

Constructor for asa_agent Objects

Description

Creates an S3 object representing an initialized ASA search agent.

Usage

```
asa_agent(python_agent, backend, model, config, llm = NULL, tools = NULL)
```

Arguments

python_agent	The underlying Python agent object
backend	LLM backend name (e.g., "openai", "groq")
model	Model identifier
config	Agent configuration list
llm	Optional LLM object used by LangGraph
tools	Optional list of tools associated with the agent

Value

An object of class asa_agent

ASA_API_ENDPOINTS

Backend API Endpoints

Description

Backend API Endpoints

Usage

```
ASA_API_ENDPOINTS
```

Format

An object of class list of length 3.

ASA_API_KEY_ENV_VARS *Environment Variables for API Keys*

Description

Environment Variables for API Keys

Usage

```
ASA_API_KEY_ENV_VARS
```

Format

An object of class `list` of length 5.

asa_audit *Audit Enumeration Results for Completeness and Quality*

Description

Validates enumeration results for completeness, consistency, and data quality using either Claude Code (CLI) or a LangGraph-based audit pipeline.

Usage

```
asa_audit(
  result,
  query = NULL,
  known_universe = NULL,
  checks = c("completeness", "consistency", "gaps", "anomalies"),
  backend = c("claude_code", "langgraph"),
  claude_model = "claude-sonnet-4-20250514",
  llm_model = "gpt-4.1-mini",
  interactive = FALSE,
  confidence_threshold = 0.8,
  timeout = 120,
  verbose = TRUE,
  agent = NULL
)
```

Arguments

<code>result</code>	An <code>asa_enumerate_result</code> object or a <code>data.frame</code> to audit
<code>query</code>	The original enumeration query (inferred from <code>result</code> if <code>NULL</code>)
<code>known_universe</code>	Optional vector of expected items for completeness check
<code>checks</code>	Character vector of checks to perform. Options: "completeness", "consistency", "gaps", "anomalies". Default runs all checks.
<code>backend</code>	Backend to use for auditing: "claude_code" (CLI) or "langgraph"

claude_model	Model to use with Claude Code backend
11m_model	Model to use with LangGraph backend
interactive	If TRUE and using claude_code backend, spawn an interactive Claude Code session instead of programmatic invocation
confidence_threshold	Flag items with confidence below this threshold
timeout	Timeout in seconds for the audit operation
verbose	Print progress messages
agent	Existing asa_agent for LangGraph backend (optional)

Details

The audit function adds three columns to the data:

- `_audit_flag`: "ok", "warning", or "suspect"
- `_audit_notes`: Explanation of any issues
- `_confidence_adjusted`: Revised confidence after audit

Audit Checks

completeness: Checks for missing items by comparing against known_universe (if provided) or using domain knowledge.

consistency: Validates data types, patterns, and value ranges.

gaps: Identifies systematic patterns of missing data (geographic, temporal, categorical gaps).

anomalies: Detects duplicates, outliers, and suspicious patterns.

Value

An `asa_audit_result` object containing:

data	Original data with audit columns added (<code>_audit_flag</code> , <code>_audit_notes</code>)
audit_summary	High-level summary of findings
issues	List of identified issues with severity and descriptions
recommendations	Suggested remediation queries
completeness_score	0-1 score for data completeness
consistency_score	0-1 score for data consistency

Examples

```
## Not run:
# Audit enumeration results with Claude Code
senators <- asa_enumerate(
  query = "Find all current US senators",
  schema = c(name = "character", state = "character", party = "character")
)
audit <- asa_audit(senators, backend = "claude_code")
print(audit)
```

```
# Audit with known universe for precise completeness check
audit <- asa_audit(senators, known_universe = state.abb)

# Interactive mode for complex audits
asa_audit(senators, backend = "claude_code", interactive = TRUE)

# Use LangGraph backend
audit <- asa_audit(senators, backend = "langgraph", agent = agent)

## End(Not run)
```

asa_audit_result *Constructor for asa_audit_result Objects*

Description

Creates an S3 object representing the result of a data quality audit.

Usage

```
asa_audit_result(
  data,
  audit_summary,
  issues,
  recommendations,
  completeness_score,
  consistency_score,
  backend_used,
  elapsed_time,
  query = NULL,
  checks = NULL
)
```

Arguments

data	data.frame with original data plus audit columns (_audit_flag, _audit_notes)
audit_summary	Character string with high-level findings
issues	List of identified issues with severity and descriptions
recommendations	Character vector of suggested remediation queries
completeness_score	Numeric 0-1 score for data completeness
consistency_score	Numeric 0-1 score for data consistency
backend_used	Which backend performed the audit ("claude_code" or "langgraph")
elapsed_time	Execution time in seconds
query	The original query (if available)
checks	Character vector of checks that were performed

Value

An object of class `asa_audit_result`

ASA_CIRCUIT_BREAKER_COOLDOWN

Circuit Breaker Cooldown Period (seconds to wait when tripped)

Description

Circuit Breaker Cooldown Period (seconds to wait when tripped)

Usage

`ASA_CIRCUIT_BREAKER_COOLDOWN`

Format

An object of class `integer` of length 1.

ASA_CIRCUIT_BREAKER_ENABLED

Enable Circuit Breaker by default

Description

Enable Circuit Breaker by default

Usage

`ASA_CIRCUIT_BREAKER_ENABLED`

Format

An object of class `logical` of length 1.

ASA_CIRCUIT_BREAKER_THRESHOLD

Circuit Breaker Error Threshold (trip if error rate exceeds this)

Description

Circuit Breaker Error Threshold (trip if error rate exceeds this)

Usage

`ASA_CIRCUIT_BREAKER_THRESHOLD`

Format

An object of class `numeric` of length 1.

ASA_CIRCUIT_BREAKER_WINDOW*Circuit Breaker Window Size (number of recent requests to consider)***Description**

Circuit Breaker Window Size (number of recent requests to consider)

Usage

```
ASA_CIRCUIT_BREAKER_WINDOW
```

Format

An object of class `integer` of length 1.

asa_config*Create ASA Configuration Object***Description**

Creates a configuration object that encapsulates all settings for ASA tasks. This provides a unified way to configure backend, model, search, temporal, and resource settings in a single object.

Usage

```
asa_config(
    backend = NULL,
    model = NULL,
    conda_env = NULL,
    proxy = NULL,
    workers = NULL,
    timeout = NULL,
    rate_limit = NULL,
    memory_folding = NULL,
    memory_threshold = NULL,
    memory_keep_recent = NULL,
    temporal = NULL,
    search = NULL,
    tor = NULL
)
```

Arguments

<code>backend</code>	LLM backend: "openai", "groq", "xai", "exo", "openrouter"
<code>model</code>	Model identifier (e.g., "gpt-4.1-mini")
<code>conda_env</code>	Conda environment name (default: "asa_env")
<code>proxy</code>	SOCKS5 proxy URL or NULL to disable

<code>workers</code>	Number of parallel workers for batch operations
<code>timeout</code>	Request timeout in seconds
<code>rate_limit</code>	Requests per second
<code>memory_folding</code>	Enable DeepAgent-style memory folding
<code>memory_threshold</code>	Messages before folding triggers
<code>memory_keep_recent</code>	Messages to preserve after folding
<code>temporal</code>	Temporal filtering options (use <code>temporal_options()</code>)
<code>search</code>	Search configuration (use <code>search_options()</code>)
<code>tor</code>	Tor registry options (use <code>tor_options()</code>)

Details

The configuration object can be passed to `run_task()`, `run_task_batch()`, `asa_enumerate()`, and other functions to provide consistent settings across operations.

Value

An object of class `asa_config`

See Also

[temporal_options](#), [search_options](#)

Examples

```
## Not run:
# Create configuration
config <- asa_config(
  backend = "openai",
  model = "gpt-4.1-mini",
  workers = 4,
  temporal = temporal_options(time_filter = "y")
)

# Use with run_task
result <- run_task(prompt, config = config)

## End(Not run)
```

Description

Default Backend

Usage

```
ASA_DEFAULT_BACKEND
```

Format

An object of class `character` of length 1.

```
ASA_DEFAULT_BUDGET_QUERIES
```

Default Budget: Queries

Description

Default Budget: Queries

Usage

```
ASA_DEFAULT_BUDGET_QUERIES
```

Format

An object of class `integer` of length 1.

```
ASA_DEFAULT_BUDGET_TIME
```

Default Budget: Time (seconds)

Description

Default Budget: Time (seconds)

Usage

```
ASA_DEFAULT_BUDGET_TIME
```

Format

An object of class `integer` of length 1.

ASA_DEFAULT_BUDGET_TOKENS

Default Budget: Tokens

Description

Default Budget: Tokens

Usage

ASA_DEFAULT_BUDGET_TOKENS

Format

An object of class `integer` of length 1.

ASA_DEFAULT_CAPTCHA_BACKOFF_BASE

Default CAPTCHA Backoff Base Multiplier

Description

Aggressive backoff on CAPTCHA: 5.0x multiplier. Results in 5s, 10s, 15s delays on successive CAPTCHA encounters.

Usage

ASA_DEFAULT_CAPTCHA_BACKOFF_BASE

Format

An object of class `numeric` of length 1.

ASA_DEFAULT_CONDA_ENV *Default Conda Environment*

Description

Default Conda Environment

Usage

ASA_DEFAULT_CONDA_ENV

Format

An object of class `character` of length 1.

ASA_DEFAULT_INTER_SEARCH_DELAY
Default Inter-Search Delay (seconds)

Description

Conservative default: 2.0 seconds between searches. More human-like pacing to avoid detection at high volumes.

Usage

ASA_DEFAULT_INTER_SEARCH_DELAY

Format

An object of class `numeric` of length 1.

ASA_DEFAULT_MAX_RESULTS
Default Max Search Results

Description

Default Max Search Results

Usage

ASA_DEFAULT_MAX_RESULTS

Format

An object of class `integer` of length 1.

ASA_DEFAULT_MAX_RETRIES
Default Max Retries

Description

Default Max Retries

Usage

ASA_DEFAULT_MAX_RETRIES

Format

An object of class `integer` of length 1.

ASA_DEFAULT_MAX_ROUNDS

Default Max Rounds for Enumeration

Description

Default Max Rounds for Enumeration

Usage

ASA_DEFAULT_MAX_ROUNDS

Format

An object of class `integer` of length 1.

ASA_DEFAULT_MEMORY_FOLDING

Default Memory Folding Enabled

Description

Default Memory Folding Enabled

Usage

ASA_DEFAULT_MEMORY_FOLDING

Format

An object of class `logical` of length 1.

ASA_DEFAULT_MEMORY_KEEP_RECENT

Default Messages to Keep After Folding

Description

Default Messages to Keep After Folding

Usage

ASA_DEFAULT_MEMORY_KEEP_RECENT

Format

An object of class `integer` of length 1.

ASA_DEFAULT_MEMORY_THRESHOLD

Default Memory Threshold (messages before folding)

Description

Default Memory Threshold (messages before folding)

Usage

ASA_DEFAULT_MEMORY_THRESHOLD

Format

An object of class `integer` of length 1.

ASA_DEFAULT_MODEL

Default Model

Description

Default Model

Usage

ASA_DEFAULT_MODEL

Format

An object of class `character` of length 1.

ASA_DEFAULT_NOVELTY_MIN

Default Minimum Novelty Rate

Description

Default Minimum Novelty Rate

Usage

ASA_DEFAULT_NOVELTY_MIN

Format

An object of class `numeric` of length 1.

ASA_DEFAULT_NOVELTY_WINDOW
Default Novelty Window

Description

Default Novelty Window

Usage

ASA_DEFAULT_NOVELTY_WINDOW

Format

An object of class `integer` of length 1.

ASA_DEFAULT_PAGE_LOAD_WAIT
Default Page Load Wait (seconds)

Description

Default Page Load Wait (seconds)

Usage

ASA_DEFAULT_PAGE_LOAD_WAIT

Format

An object of class `numeric` of length 1.

ASA_DEFAULT_PLATEAU_ROUNDS
Default Plateau Rounds for Stopping

Description

Default Plateau Rounds for Stopping

Usage

ASA_DEFAULT_PLATEAU_ROUNDS

Format

An object of class `integer` of length 1.

ASA_DEFAULT_PROXY	<i>Default Proxy URL (Tor SOCKS5)</i>
-------------------	---------------------------------------

Description

Default Proxy URL (Tor SOCKS5)

Usage

ASA_DEFAULT_PROXY

Format

An object of class `character` of length 1.

ASA_DEFAULT_RATE_LIMIT	<i>Default Rate Limit (requests per second)</i>
------------------------	-------------------------------------------------

Description

Conservative default: 0.1 = 10 seconds between requests. Tuned for heavy volume (1000+ queries/day) to reduce CAPTCHA/blocks.

Usage

ASA_DEFAULT_RATE_LIMIT

Format

An object of class `numeric` of length 1.

ASA_DEFAULT_TEMPERATURES	<i>Default Temperatures by Backend</i>
--------------------------	----------------------------------------

Description

Default Temperatures by Backend

Usage

ASA_DEFAULT_TEMPERATURES

Format

An object of class `list` of length 5.

ASA_DEFAULT_TIMEOUT	<i>Default Request Timeout (seconds)</i>
---------------------	------------------------------------------

Description

Default Request Timeout (seconds)

Usage

ASA_DEFAULT_TIMEOUT

Format

An object of class `integer` of length 1.

ASA_DEFAULT_WIKI_CHARS	<i>Default Wikipedia Content Chars</i>
------------------------	----------------------------------------

Description

Default Wikipedia Content Chars

Usage

ASA_DEFAULT_WIKI_CHARS

Format

An object of class `integer` of length 1.

ASA_DEFAULT_WIKI_TOP_K	<i>Default Wikipedia Top K Results</i>
------------------------	----------------------------------------

Description

Default Wikipedia Top K Results

Usage

ASA_DEFAULT_WIKI_TOP_K

Format

An object of class `integer` of length 1.

ASA_DEFAULT_WORKERS	<i>Default Max Workers for Enumeration</i>
---------------------	--------------------------------------------

Description

Default Max Workers for Enumeration

Usage

```
ASA_DEFAULT_WORKERS
```

Format

An object of class `integer` of length 1.

asa_enumerate	<i>Multi-Agent Research for Open-Ended Queries</i>
---------------	----------------------------------------------------

Description

Performs intelligent open-ended research tasks using multi-agent orchestration. Decomposes complex queries into sub-tasks, executes parallel searches, and aggregates results into structured output (data.frame, CSV, or JSON).

Usage

```
asa_enumerate(
  query,
  schema = NULL,
  output = c("data.frame", "csv", "json"),
  workers = NULL,
  max_rounds = NULL,
  budget = list(queries = 50L, tokens = 200000L, time_sec = 300L),
  stop_policy = list(target_items = NULL, plateau_rounds = 2L, novelty_min = 0.05,
    novelty_window = 20L),
  sources = list(web = TRUE, wikipedia = TRUE, wikidata = TRUE),
  temporal = NULL,
  pagination = TRUE,
  progress = TRUE,
  include_provenance = FALSE,
  checkpoint = TRUE,
  checkpoint_dir = tempdir(),
  resume_from = NULL,
  agent = NULL,
  backend = NULL,
  model = NULL,
  conda_env = NULL,
  verbose = TRUE
)
```

Arguments

query	Character string describing the research goal. Examples: "Find all current US senators with their state, party, and term end date"
schema	Named character vector defining the output schema. Names are column names, values are R types ("character", "numeric", "logical"). Use NULL or "auto" for LLM-proposed schema.
output	Output format: "data.frame" (default), "csv", or "json".
workers	Number of parallel search workers. Defaults to value from ASA_DEFAULT_WORKERS (typically 4).
max_rounds	Maximum research iterations. Defaults to value from ASA_DEFAULT_MAX_ROUNDS (typically 8).
budget	Named list with resource limits: <ul style="list-style-type: none"> queries: Maximum search queries (default: 50) tokens: Maximum LLM tokens (default: 200000) time_sec: Maximum execution time in seconds (default: 300)
stop_policy	Named list with stopping criteria: <ul style="list-style-type: none"> target_items: Stop when this many items found (NULL = unknown) plateau_rounds: Stop after N rounds with no new items (default: 2) novelty_min: Minimum new items ratio per round (default: 0.05) novelty_window: Window size for novelty calculation (default: 20)
sources	Named list controlling which sources to use: <ul style="list-style-type: none"> web: Use DuckDuckGo web search (default: TRUE) wikipedia: Use Wikipedia (default: TRUE) wikidata: Use Wikidata SPARQL for authoritative enumerations (default: TRUE)
temporal	Named list for temporal filtering: <ul style="list-style-type: none"> after: ISO 8601 date string (e.g., "2020-01-01") - results after this date before: ISO 8601 date string (e.g., "2024-01-01") - results before this date time_filter: DuckDuckGo time filter ("d", "w", "m", "y") for day/week/month/year strictness: "best_effort" (default) or "strict" (verifies dates via metadata) use_wayback: Use Wayback Machine for strict pre-date guarantees (default: FALSE)
pagination	Enable pagination for large result sets (default: TRUE).
progress	Show progress bar and status updates (default: TRUE).
include_provenance	Include source URLs and confidence per row (default: FALSE).
checkpoint	Enable auto-save after each round (default: TRUE).
checkpoint_dir	Directory for checkpoint files (default: tempdir()).
resume_from	Path to checkpoint file to resume from (default: NULL).
agent	An initialized <code>asa_agent</code> object. If NULL, uses the current agent or creates a new one with specified backend/model.
backend	LLM backend if creating new agent: "openai", "groq", "xai", "openrouter".
model	Model identifier if creating new agent.
conda_env	Conda environment name (default: "asa_env").
verbose	Print status messages (default: TRUE).

Details

The function uses a multi-agent architecture:

1. **Planner:** Decomposes query into facets and identifies authoritative sources
2. **Dispatcher:** Spawns parallel workers for each facet
3. **Workers:** Execute searches using DDG, Wikipedia, and Wikidata
4. **Extractor:** Normalizes results to match schema
5. **Deduper:** Removes duplicates using hash + fuzzy matching
6. **Stopper:** Evaluates stopping criteria (novelty, budget, saturation)

For known entity types (US senators, countries, Fortune 500), Wikidata provides authoritative enumerations with complete, verified data.

Value

An object of class `asa_enumerate_result` containing:

- `data`: `data.frame` with results matching the schema
- `status`: "complete", "partial", or "failed"
- `stop_reason`: Why the search stopped
- `metrics`: List with rounds, `queries_used`, `novelty_curve`, `coverage`
- `provenance`: If `include_provenance=TRUE`, source info per row
- `checkpoint_file`: Path to checkpoint if saved

Checkpointing

With `checkpoint=TRUE`, state is saved after each round. If interrupted, use `resume_from` to continue from the last checkpoint:

```
result <- asa_enumerate(query, resume_from = "/path/to/checkpoint.rds")
```

Schema

The schema defines expected output columns:

```
schema = c(name = "character", state = "character", party = "character")
```

With `schema = "auto"`, the planner agent proposes a schema based on the query.

See Also

[run_task](#), [initialize_agent](#)

Examples

```
## Not run:
# Find all US senators
senators <- asa_enumerate(
  query = "Find all current US senators with state, party, and term end date",
  schema = c(name = "character", state = "character",
             party = "character", term_end = "character"),
  stop_policy = list(target_items = 100),
  include_provenance = TRUE
)
head(senators$data)

# Find countries with auto schema
countries <- asa_enumerate(
  query = "Find all countries with their capitals and populations",
  schema = "auto",
  output = "csv"
)

# Resume from checkpoint
result <- asa_enumerate(
  query = "Find Fortune 500 CEOs",
  resume_from = "/tmp/asa_enumerate_abc123.rds"
)

# Temporal filtering: results from specific date range
companies_2020s <- asa_enumerate(
  query = "Find tech companies founded recently",
  temporal = list(
    after = "2020-01-01",
    before = "2024-01-01",
    strictness = "best_effort"
  )
)

# Temporal filtering: past year with DuckDuckGo time filter
recent_news <- asa_enumerate(
  query = "Find AI research breakthroughs",
  temporal = list(
    time_filter = "y" # past year
  )
)

# Strict temporal filtering with Wayback Machine
historical <- asa_enumerate(
  query = "Find Fortune 500 companies",
  temporal = list(
    before = "2015-01-01",
    strictness = "strict",
    use_wayback = TRUE
  )
)

## End(Not run)
```

`asa_enumerate_result` *Constructor for asa_enumerate_result Objects*

Description

Creates an S3 object representing the result of an enumeration task.

Usage

```
asa_enumerate_result(
  data,
  status,
  stop_reason,
  metrics,
  provenance = NULL,
  plan = NULL,
  checkpoint_file = NULL,
  query = NULL,
  schema = NULL
)
```

Arguments

<code>data</code>	data.frame containing the enumeration results
<code>status</code>	Result status: "complete", "partial", or "failed"
<code>stop_reason</code>	Why the enumeration stopped (e.g., "target_reached", "novelty_plateau")
<code>metrics</code>	List with execution metrics (rounds, queries_used, etc.)
<code>provenance</code>	Optional data.frame with source information per row
<code>plan</code>	The enumeration plan from the planner agent
<code>checkpoint_file</code>	Path to saved checkpoint file
<code>query</code>	The original enumeration query
<code>schema</code>	The schema used for extraction

Value

An object of class `asa_enumerate_result`

`ASA_HUMANIZE_TIMING` *Enable Humanized Timing (random jitter on delays)*

Description

Enable Humanized Timing (random jitter on delays)

Usage

```
ASA_HUMANIZE_TIMING
```

Format

An object of class `logical` of length 1.

ASA_JITTER_FACTOR	<i>Jitter Factor for random timing variation</i>
-------------------	--------------------------------------------------

Description

Jitter Factor for random timing variation

Usage

`ASA_JITTER_FACTOR`

Format

An object of class `numeric` of length 1.

ASA_OUTPUT_FORMATS	<i>Valid Output Formats</i>
--------------------	-----------------------------

Description

Valid Output Formats

Usage

`ASA_OUTPUT_FORMATS`

Format

An object of class `character` of length 3.

ASA_PRINT_WIDTH	<i>Print Width for Output</i>
-----------------	-------------------------------

Description

Print Width for Output

Usage

`ASA_PRINT_WIDTH`

Format

An object of class `integer` of length 1.

ASA_PROACTIVE_ROTATION_ENABLED

Enable Proactive Tor Circuit Rotation

Description

When TRUE, rotate Tor circuit every N requests (not just on error).

Usage

ASA_PROACTIVE_ROTATION_ENABLED

Format

An object of class `logical` of length 1.

ASA_PROACTIVE_ROTATION_INTERVAL

Proactive Rotation Interval (requests)

Description

Rotate Tor circuit every 15 requests to get fresh exit node IP.

Usage

ASA_PROACTIVE_ROTATION_INTERVAL

Format

An object of class `integer` of length 1.

ASA_RATE_LIMIT_BUCKET_SIZE

Proactive Rate Limit Bucket Size (max tokens)

Description

Proactive Rate Limit Bucket Size (max tokens)

Usage

ASA_RATE_LIMIT_BUCKET_SIZE

Format

An object of class `integer` of length 1.

ASA_RATE_LIMIT_PROACTIVE

Enable Proactive Rate Limiting (default: TRUE)

Description

Enable Proactive Rate Limiting (default: TRUE)

Usage

ASA_RATE_LIMIT_PROACTIVE

Format

An object of class logical of length 1.

ASA_RATE_LIMIT_WAIT *Rate Limit Wait Time (seconds)*

Description

Rate Limit Wait Time (seconds)

Usage

ASA_RATE_LIMIT_WAIT

Format

An object of class integer of length 1.

ASA_RECUSION_LIMIT_FOLDING
Recursion Limit with Memory Folding

Description

Recursion Limit with Memory Folding

Usage

ASA_RECUSION_LIMIT_FOLDING

Format

An object of class integer of length 1.

ASA_RECUSION_LIMIT_STANDARD

Recursion Limit without Memory Folding

Description

Recursion Limit without Memory Folding

Usage

ASA_RECUSION_LIMIT_STANDARD

Format

An object of class `integer` of length 1.

asa_response

Constructor for asa_response Objects

Description

Creates an S3 object representing an agent response.

Usage

```
asa_response(
    message,
    status_code,
    raw_response,
    trace,
    elapsed_time,
    fold_count,
    prompt
)
```

Arguments

<code>message</code>	The final response text
<code>status_code</code>	Status code (200 = success, 100 = error)
<code>raw_response</code>	The full Python response object
<code>trace</code>	Full text trace of agent execution
<code>elapsed_time</code>	Execution time in minutes
<code>fold_count</code>	Number of memory folds performed
<code>prompt</code>	The original prompt

Value

An object of class `asa_response`

asa_result*Constructor for asa_result Objects*

Description

Creates an S3 object representing the result of a research task.

Usage

```
asa_result(  
  prompt,  
  message,  
  parsed,  
  raw_output,  
  elapsed_time,  
  status,  
  search_tier = "unknown",  
  parsing_status = NULL  
)
```

Arguments

<code>prompt</code>	The original prompt
<code>message</code>	The agent's response text
<code>parsed</code>	Parsed output (list or NULL)
<code>raw_output</code>	Full agent trace
<code>elapsed_time</code>	Execution time in minutes
<code>status</code>	Status ("success" or "error")
<code>search_tier</code>	Which search tier was used ("primp", "selenium", "ddgs", "requests", or "unknown"). Useful for assessing result quality.
<code>parsing_status</code>	List with JSON parsing validation info: valid (logical), reason ("ok", "parsing_failed", "not_object", "missing_fields", "null_values", "no_validation"), and missing (character vector of missing/invalid fields).

Value

An object of class `asa_result`

ASA_SESSION_RESET_ENABLED*Enable Session Reset*

Description

When TRUE, periodically reset session identity to avoid fingerprinting.

Usage

ASA_SESSION_RESET_ENABLED

Format

An object of class logical of length 1.

ASA_SESSION_RESET_INTERVAL

*Session Reset Interval (requests)***Description**

Reset session identity every 50 requests (clear cookies, shuffle UA).

Usage

ASA_SESSION_RESET_INTERVAL

Format

An object of class integer of length 1.

ASA_STATUS_ERROR

*Status Code: Error***Description**

Status Code: Error

Usage

ASA_STATUS_ERROR

Format

An object of class integer of length 1.

ASA_STATUS_SUCCESS

*Status Code: Success***Description**

Status Code: Success

Usage

ASA_STATUS_SUCCESS

Format

An object of class integer of length 1.

ASA_SUPPORTED_BACKENDS

Supported Backends

Description

Supported Backends

Usage

ASA_SUPPORTED_BACKENDS

Format

An object of class character of length 5.

ASA_TEMPORAL_STRICTNESS

Valid Temporal Strictness Levels

Description

Valid Temporal Strictness Levels

Usage

ASA_TEMPORAL_STRICTNESS

Format

An object of class character of length 2.

ASA_TIME_FILTERS

Valid Temporal Time Filters

Description

Valid Temporal Time Filters

Usage

ASA_TIME_FILTERS

Format

An object of class character of length 4.

ASA_TOR_BAD_TTL	<i>Tor Exit Bad TTL (seconds)</i>
-----------------	-----------------------------------

Description

How long to keep a bad/tainted exit before allowing reuse.

Usage

ASA_TOR_BAD_TTL

Format

An object of class `numeric` of length 1.

ASA_TOR_GOOD_TTL	<i>Tor Exit Good TTL (seconds)</i>
------------------	------------------------------------

Description

How long to treat an exit as good before requiring a refresh.

Usage

ASA_TOR_GOOD_TTL

Format

An object of class `numeric` of length 1.

ASA_TOR_IP_CACHE_TTL	<i>Tor Exit IP Cache TTL (seconds)</i>
----------------------	----------------------------------------

Description

How long to cache exit IP lookups before refreshing.

Usage

ASA_TOR_IP_CACHE_TTL

Format

An object of class `numeric` of length 1.

ASA_TOR_MAX_ROTATION_ATTEMPTS

Tor Rotation Attempts when Exit is Bad/Overused

Description

Tor Rotation Attempts when Exit is Bad/Overused

Usage

ASA_TOR_MAX_ROTATION_ATTEMPTS

Format

An object of class `integer` of length 1.

ASA_TOR_MIN_ROTATION_INTERVAL

Minimum Tor Rotation Interval (seconds)

Description

Minimum time between Tor circuit rotations to avoid hammering.

Usage

ASA_TOR_MIN_ROTATION_INTERVAL

Format

An object of class `numeric` of length 1.

ASA_TOR_OVERUSE_DECAY *Tor Exit Overuse Decay Window (seconds)*

Description

Time window for counting recent uses before decaying counts.

Usage

ASA_TOR_OVERUSE_DECAY

Format

An object of class `numeric` of length 1.

ASA_TOR_OVERUSE_THRESHOLD

Tor Exit Overuse Threshold

Description

Maximum recent uses before a good exit is considered overloaded.

Usage

ASA_TOR_OVERUSE_THRESHOLD

Format

An object of class `integer` of length 1.

ASA_TOR_REGISTRY_ENABLED

Enable Shared Tor Exit Registry

Description

When TRUE, track Tor exit IP health (good/bad/overused) in a shared store.

Usage

ASA_TOR_REGISTRY_ENABLED

Format

An object of class `logical` of length 1.

ASA_TRUNCATE_LENGTH

String Truncation Length

Description

String Truncation Length

Usage

ASA_TRUNCATE_LENGTH

Format

An object of class `integer` of length 1.

build_backend	<i>Build the Python Backend Environment</i>
---------------	---------------------------------------------

Description

Creates a conda environment with all required Python dependencies for the asa search agent, including LangChain, LangGraph, and search tools.

Usage

```
build_backend(conda_env = "asa_env", conda = "auto", python_version = "3.13")
```

Arguments

conda_env	Name of the conda environment (default: "asa_env")
conda	Path to conda executable (default: "auto")
python_version	Python version to use (default: "3.13")

Details

This function creates a new conda environment and installs the following Python packages:

- langchain_groq, langchain_community, langchain_openai
- langgraph
- ddgs (DuckDuckGo search)
- selenium, primp (browser automation)
- undetected-chromedriver (stealth Chrome)
- beautifulsoup4, requests
- fake_headers, httpx
- stem (Tor control)
- pysocks, socksio (proxy support)

Value

Invisibly returns NULL; called for side effects.

Examples

```
## Not run:  
# Create the default environment  
build_backend()  
  
# Create with a custom name  
build_backend(conda_env = "my_asa_env")  
  
## End(Not run)
```

build_prompt	<i>Build a Task Prompt from Template</i>
---------------------	------------------------------------------

Description

Creates a formatted prompt by substituting variables into a template.

Usage

```
build_prompt(template, ...)
```

Arguments

template	A character string with placeholders in the form {variable_name}
...	Named arguments to substitute into the template

Value

A formatted prompt string

Examples

```
## Not run:
prompt <- build_prompt(
  template = "Find information about {{name}} in {{country}} during {{year}}",
  name = "Marie Curie",
  country = "France",
  year = 1903
)
## End(Not run)
```

check_backend	<i>Check Python Environment Availability</i>
----------------------	----------------------------------------------

Description

Checks if the required Python environment and packages are available.

Usage

```
check_backend(conda_env = "asa_env")
```

Arguments

conda_env	Name of the conda environment to check
-----------	----------------------------------------

Value

A list with components:

- available: Logical, TRUE if environment is ready
- conda_env: Name of the environment checked
- python_version: Python version if available
- missing_packages: Character vector of missing packages (if any)

Examples

```
## Not run:  
status <- check_backend()  
if (!status$available) {  
  build_backend()  
}  
  
## End(Not run)
```

clean_whitespace

Clean Whitespace

Description

Normalizes whitespace in a string by collapsing multiple spaces and trimming leading/trailing whitespace.

Usage

```
clean_whitespace(x)
```

Arguments

x	Character string
---	------------------

Value

Cleaned string

configure_search *Configure Python Search Parameters*

Description

Sets global configuration values for the Python search module. These values control timeouts, retry behavior, and result limits.

Usage

```
configure_search(
  max_results = NULL,
  timeout = NULL,
  max_retries = NULL,
  retry_delay = NULL,
  backoff_multiplier = NULL,
  captcha_backoff_base = NULL,
  page_load_wait = NULL,
  inter_search_delay = NULL,
  conda_env = "asa_env"
)
```

Arguments

max_results	Maximum number of search results to return (default: 10)
timeout	HTTP request timeout in seconds (default: 15)
max_retries	Maximum retry attempts on failure (default: 3)
retry_delay	Initial delay between retries in seconds (default: 2)
backoff_multiplier	Multiplier for exponential backoff (default: 1.5)
captcha_backoff_base	Base multiplier for CAPTCHA backoff (default: 3)
page_load_wait	Wait time after page load in seconds (default: 2)
inter_search_delay	Delay between consecutive searches in seconds (default: 0.5)
conda_env	Name of the conda environment (default: "asa_env")

Value

Invisibly returns a list with the current configuration

Examples

```
## Not run:
# Increase timeout for slow connections
configure_search(timeout = 30, max_retries = 5)

# Get more results
configure_search(max_results = 20)
```

```
# Add delay between searches to avoid rate limiting
configure_search(inter_search_delay = 2.0)

## End(Not run)
```

configure_search_logging

Configure Python Search Logging Level

Description

Sets the logging level for the Python search module. This controls how much diagnostic output is produced during web searches.

Usage

```
configure_search_logging(level = "WARNING", conda_env = "asa_env")
```

Arguments

level	Log level: "DEBUG", "INFO", "WARNING" (default), "ERROR", or "CRITICAL"
conda_env	Name of the conda environment (default: "asa_env")

Details

Log levels from most to least verbose:

- DEBUG: Detailed diagnostic information for debugging
- INFO: General operational information
- WARNING: Indicates something unexpected but not an error (default)
- ERROR: Serious problems that prevented an operation
- CRITICAL: Very serious errors

Value

Invisibly returns the current logging level

Examples

```
## Not run:
# Enable verbose debugging output
configure_search_logging("DEBUG")

# Run a search (will show detailed logs)
result <- run_task("What is the population of Tokyo?", agent = agent)

# Disable verbose output
configure_search_logging("WARNING")

## End(Not run)
```

<code>configure_temporal</code>	<i>Configure Temporal Filtering for Search</i>
---------------------------------	------------------------------------------------

Description

Sets or clears temporal filtering on the DuckDuckGo search tool. This affects all subsequent searches until changed or cleared.

Usage

```
configure_temporal(time_filter = NULL)
```

Arguments

<code>time_filter</code>	DuckDuckGo time filter: "d" (day), "w" (week), "m" (month), "y" (year), or NULL/NA/"none" to clear
--------------------------	-------------------------------------------------------------------------------------------------------

Details

This function modifies the search tool's time parameter, which is passed to DuckDuckGo as the `df` parameter. The filter restricts results to content indexed within the specified time period.

Note: This only affects DuckDuckGo searches. For Wikidata queries with temporal filtering, use `asa_enumerate()` with its `temporal` parameter.

Value

Invisibly returns the previous time filter setting

Time Filter Values

- "d": Past 24 hours (day)
- "w": Past 7 days (week)
- "m": Past 30 days (month)
- "y": Past 365 days (year)
- NULL, NA, or "none": No time restriction (default)

See Also

[run_task](#), [asa_enumerate](#)

Examples

```
## Not run:
# Restrict to past year
configure_temporal("y")
result <- run_task("Find recent AI breakthroughs", agent = agent)

# Clear temporal filter
configure_temporal(NULL)

# Past week only
```

```
configure_temporal("w")
## End(Not run)
```

```
configure_tor_registry
```

Configure Tor Exit Registry

Description

Sets up the shared Tor exit health registry used by the Python search stack to avoid reusing tainted or overused exit nodes.

Usage

```
configure_tor_registry(
    registry_path = NULL,
    enable = ASA_TOR_REGISTRY_ENABLED,
    bad_ttl = ASA_TOR_BAD_TTL,
    good_ttl = ASA_TOR_GOOD_TTL,
    overuse_threshold = ASA_TOR_OVERUSE_THRESHOLD,
    overuse_decay = ASA_TOR_OVERUSE_DECAY,
    max_rotation_attempts = ASA_TOR_MAX_ROTATION_ATTEMPTS,
    ip_cache_ttl = ASA_TOR_IP_CACHE_TTL,
    conda_env = "asa_env"
)
```

Arguments

registry_path	Path to the SQLite registry file (default: user cache).
enable	Enable the registry (set FALSE to disable tracking).
bad_ttl	Seconds to keep a bad/tainted exit before reuse.
good_ttl	Seconds to treat an exit as good before refreshing.
overuse_threshold	Maximum recent uses before a good exit is treated as overloaded.
overuse_decay	Window (seconds) for counting recent uses before decay.
max_rotation_attempts	Maximum rotations to find a clean exit.
ip_cache_ttl	Seconds to cache exit IP lookups.
conda_env	Conda environment name for the Python module.

Value

Invisibly returns a list of the configured values (or NULL on error).

decode_html	<i>Decode HTML Entities</i>
-------------	-----------------------------

Description

Converts HTML entities to their character equivalents.

Usage

```
decode_html(x)
```

Arguments

x	Character string with HTML entities
---	-------------------------------------

Value

Decoded string

extract_agent_results	<i>Extract Structured Data from Agent Traces</i>
-----------------------	--------------------------------------------------

Description

Parses raw agent output to extract search snippets, Wikipedia content, URLs, JSON data, and search tier information. This is the main function for post-processing agent traces.

Usage

```
extract_agent_results(raw_output)
```

Arguments

raw_output	Raw output string from agent invocation (the trace field from an asa_response object)
------------	---------------------------------------------------------------------------------------

Value

A list with components:

- **search_snippets**: Character vector of search result content
- **search_urls**: Character vector of URLs from search results
- **wikipedia_snippets**: Character vector of Wikipedia content
- **json_data**: Extracted JSON data as a list (if present)
- **search_tiers**: Character vector of unique search tiers used (e.g., "primp", "selenium", "ddgs", "requests")

Examples

```
## Not run:
response <- run_agent("Who is the president of France?", agent)
extracted <- extract_agent_results(response$trace)
print(extracted$search_snippets)
print(extracted$search_tiers) # Shows which search tier was used

## End(Not run)
```

extract_search_snippets

Extract Search Snippets by Source Number

Description

Extracts content from Search tool messages in the agent trace.

Usage

```
extract_search_snippets(text)
```

Arguments

text	Raw agent trace text
------	----------------------

Value

Character vector of search snippets, ordered by source number

Examples

```
## Not run:
snippets <- extract_search_snippets(response$trace)

## End(Not run)
```

extract_search_tiers

Extract Search Tier Information

Description

Extracts which search tier was used from the agent trace. The search module uses a multi-tier fallback system:

- primp: Fast HTTP client with browser impersonation (Tier 0)
- selenium: Headless browser for JS-rendered content (Tier 1)
- ddgs: Standard DDGS Python library (Tier 2)
- requests: Raw POST to DuckDuckGo HTML endpoint (Tier 3)

Usage

```
extract_search_tiers(text)
```

Arguments

text Raw agent trace text

Value

Character vector of unique tier names encountered (e.g., "primp", "selenium", "ddgs", "requests")

Examples

```
## Not run:  
tiers <- extract_search_tiers(response$trace)  
print(tiers) # e.g., "primp"  
  
## End(Not run)
```

extract_urls

Extract URLs by Source Number

Description

Extracts URLs from Search tool messages in the agent trace.

Usage

```
extract_urls(text)
```

Arguments

text Raw agent trace text

Value

Character vector of URLs, ordered by source number

Examples

```
## Not run:  
urls <- extract_urls(response$trace)  
  
## End(Not run)
```

extract_wikipedia_content
Extract Wikipedia Content

Description

Extracts content from Wikipedia tool messages in the agent trace.

Usage

```
extract_wikipedia_content(text)
```

Arguments

text Raw agent trace text

Value

Character vector of Wikipedia snippets

Examples

```
## Not run:  
wiki <- extract_wikipedia_content(response$trace)  
  
## End(Not run)
```

format_duration *Format Time Duration*

Description

Formats a numeric duration (in minutes) as a human-readable string.

Usage

```
format_duration(minutes)
```

Arguments

minutes Numeric duration in minutes

Value

Formatted string

get_agent	<i>Get the Current Agent</i>
-----------	------------------------------

Description

Returns the currently initialized agent, or NULL if not initialized.

Usage

```
get_agent()
```

Value

An asa_agent object or NULL

Examples

```
## Not run:
agent <- get_agent()
if (is.null(agent)) {
  agent <- initialize_agent()
}

## End(Not run)
```

get_tor_ip	<i>Get External IP via Tor</i>
------------	--------------------------------

Description

Retrieves the external IP address as seen through Tor proxy.

Usage

```
get_tor_ip(proxy = "socks5h://127.0.0.1:9050", timeout = 30L)
```

Arguments

proxy	Tor proxy URL (e.g., "socks5h://127.0.0.1:9050" for default, or "socks5h://127.0.0.1:9055" for instance on port 9055)
timeout	Timeout in seconds (default: 30). Useful for parallel workloads where some Tor exits may be slow.

Value

IP address string or NA on failure

Examples

```

## Not run:
# Default Tor instance
ip <- get_tor_ip()
message("Current Tor IP: ", ip)

# Check specific Tor instance (e.g., for parallel jobs)
ip <- get_tor_ip(proxy = "socks5h://127.0.0.1:9055")

## End(Not run)

```

initialize_agent	<i>Initialize the ASA Search Agent</i>
------------------	----------------------------------------

Description

Initializes the Python environment and creates the LangGraph agent with search tools (Wikipedia, DuckDuckGo). The agent can use multiple LLM backends and supports DeepAgent-style memory folding.

Usage

```

initialize_agent(
  backend = "openai",
  model = "gpt-4.1-mini",
  conda_env = "asa_env",
  proxy = "socks5h://127.0.0.1:9050",
  use_memory_folding = TRUE,
  memory_threshold = 4L,
  memory_keep_recent = 2L,
  rate_limit = 0.2,
  timeout = 120L,
  tor = tor_options(),
  verbose = TRUE
)

```

Arguments

backend	LLM backend to use. One of: "openai", "groq", "xai", "exo", "openrouter"
model	Model identifier (e.g., "gpt-4.1-mini", "llama-3.3-70b-versatile")
conda_env	Name of the conda environment with Python dependencies
proxy	SOCKS5 proxy URL for Tor (default: "socks5h://127.0.0.1:9050"). Set to NULL to disable proxy.
use_memory_folding	Enable DeepAgent-style memory compression (default: TRUE)
memory_threshold	Number of messages before folding triggers (default: 4)
memory_keep_recent	Number of recent messages to preserve after folding (default: 2)

<code>rate_limit</code>	Requests per second for rate limiting (default: 0.2)
<code>timeout</code>	Request timeout in seconds (default: 120)
<code>tor</code>	Tor registry options from <code>tor_options</code> . Disable shared tracking by setting <code>dirty_tor_exists = FALSE</code> .
<code>verbose</code>	Print status messages (default: TRUE)

Details

The agent is created with two tools:

- Wikipedia: For looking up encyclopedic information
- DuckDuckGo Search: For web searches with a 4-tier fallback system (PRIMP -> Selenium -> DDGS library -> raw requests)

Memory folding (enabled by default) compresses older messages into a summary to manage context length in long conversations, following the DeepAgent paper.

Value

An object of class `asa_agent` containing the initialized agent and configuration.

API Keys

The following environment variables should be set based on your backend:

- OpenAI: `OPENAI_API_KEY`
- Groq: `GROQ_API_KEY`
- xAI: `XAI_API_KEY`
- OpenRouter: `OPENROUTER_API_KEY`

OpenRouter Models

When using the "openrouter" backend, model names must be in provider/model-name format.
Examples:

- "openai/gpt-4o"
- "anthropic/clause-3-sonnet"
- "google/gemma-2-9b-it:free"
- "meta-llama/llama-3-70b-instruct"

See <https://openrouter.ai/models> for available models.

See Also

[run_task](#), [run_task_batch](#)

Examples

```
## Not run:
# Initialize with OpenAI
agent <- initialize_agent(
  backend = "openai",
  model = "gpt-4.1-mini"
)

# Initialize with Groq and custom settings
agent <- initialize_agent(
  backend = "groq",
  model = "llama-3.3-70b-versatile",
  use_memory_folding = FALSE,
  proxy = NULL # No Tor proxy
)

# Initialize with OpenRouter (access to 100+ models)
agent <- initialize_agent(
  backend = "openrouter",
  model = "anthropic/clause-3-sonnet" # Note: provider/model format
)

## End(Not run)
```

<code>is_tor_running</code>	<i>Check if Tor is Running</i>
-----------------------------	--------------------------------

Description

Checks if Tor is running and accessible on the default port.

Usage

```
is_tor_running(port = 9050L)
```

Arguments

<code>port</code>	Port number (default: 9050)
-------------------	-----------------------------

Value

Logical indicating if Tor appears to be running

Examples

```
## Not run:
if (!is_tor_running()) {
  message("Start Tor with: brew services start tor")
}

## End(Not run)
```

json_escape	<i>Clean Text for JSON Output</i>
-------------	-----------------------------------

Description

Escapes special characters in text for safe inclusion in JSON strings.

Usage

```
json_escape(x)
```

Arguments

x	Character string to escape
---	----------------------------

Value

Escaped string

print.asa_agent	<i>Print Method for asa_agent Objects</i>
-----------------	-------------------------------------------

Description

Print Method for asa_agent Objects

Usage

```
## S3 method for class 'asa_agent'  
print(x, ...)
```

Arguments

x	An asa_agent object
...	Additional arguments (ignored)

Value

Invisibly returns the object

print.asa_audit_result

Print Method for asa_audit_result Objects

Description

Print Method for asa_audit_result Objects

Usage

```
## S3 method for class 'asa_audit_result'  
print(x, n = 6, ...)
```

Arguments

x	An asa_audit_result object
n	Number of data rows to preview (default: 6)
...	Additional arguments (ignored)

Value

Invisibly returns the object

print.asa_config

Print Method for asa_config Objects

Description

Print Method for asa_config Objects

Usage

```
## S3 method for class 'asa_config'  
print(x, ...)
```

Arguments

x	An asa_config object
...	Additional arguments (ignored)

Value

Invisibly returns the object

print.asa_enumerate_result

Print Method for asa_enumerate_result Objects

Description

Print Method for asa_enumerate_result Objects

Usage

```
## S3 method for class 'asa_enumerate_result'  
print(x, n = 6, ...)
```

Arguments

x	An asa_enumerate_result object
n	Number of data rows to preview (default: 6)
...	Additional arguments (ignored)

Value

Invisibly returns the object

print.asa_response

Print Method for asa_response Objects

Description

Print Method for asa_response Objects

Usage

```
## S3 method for class 'asa_response'  
print(x, ...)
```

Arguments

x	An asa_response object
...	Additional arguments (ignored)

Value

Invisibly returns the object

print.asa_result *Print Method for asa_result Objects*

Description

Print Method for asa_result Objects

Usage

```
## S3 method for class 'asa_result'  
print(x, ...)
```

Arguments

x	An asa_result object
...	Additional arguments (ignored)

Value

Invisibly returns the object

print.asa_search *Print Method for asa_search Objects*

Description

Print Method for asa_search Objects

Usage

```
## S3 method for class 'asa_search'  
print(x, ...)
```

Arguments

x	An asa_search object
...	Additional arguments (ignored)

print.asa_temporal *Print Method for asa_temporal Objects*

Description

Print Method for asa_temporal Objects

Usage

```
## S3 method for class 'asa_temporal'  
print(x, ...)
```

Arguments

x	An asa_temporal object
...	Additional arguments (ignored)

Value

Invisibly returns the object

print.asa_tor *Print Method for asa_tor Objects*

Description

Print Method for asa_tor Objects

Usage

```
## S3 method for class 'asa_tor'  
print(x, ...)
```

Arguments

x	An asa_tor object
...	Additional arguments (ignored)

Value

Invisibly returns the object

`print2`*Print Utility*

Description

Wrapper around cat for consistent output formatting.

Usage

```
print2(...)
```

Arguments

... Arguments passed to cat

`process_outputs`*Process Multiple Agent Outputs*

Description

Processes a data frame of raw agent outputs, extracting structured data.

Usage

```
process_outputs(df, parallel = FALSE, workers = 10L)
```

Arguments

<code>df</code>	Data frame with a 'raw_output' column containing agent traces
<code>parallel</code>	Use parallel processing
<code>workers</code>	Number of workers

Value

The input data frame with additional extracted columns: search_count, wiki_count, and any JSON fields found

`reset_agent`*Reset the Agent***Description**

Clears the initialized agent state, forcing reinitialization on next use. Also closes any open HTTP clients to prevent resource leaks.

Usage

```
reset_agent()
```

Value

Invisibly returns NULL

`rotate_tor_circuit`*Rotate Tor Circuit (R-side, daemon restart)***Description**

Requests a new Tor circuit by restarting the Tor service or sending SIGHUP.

Usage

```
rotate_tor_circuit(
  method = c("signal", "brew", "systemctl"),
  wait = 12L,
  pid = NULL
)
```

Arguments

<code>method</code>	Method to restart: "brew" (macOS), "systemctl" (Linux), or "signal"
<code>wait</code>	Seconds to wait for new circuit (default: 12)
<code>pid</code>	Optional PID of specific Tor process (only used with <code>method="signal"</code>). If NULL (default), finds the Tor process via pgrep.

Details

MEDIUM FIX: This function restarts the entire Tor daemon, which kills ALL circuits and affects parallel execution. For production use, prefer the Python-side control port rotation which sends SIGNAL NEWNYM to get a new circuit without restarting the daemon.

For parallel Tor setups with multiple instances, consider using Tor's built-in circuit rotation via `MaxCircuitDirtiness` and `NewCircuitPeriod` config options instead of this function.

Value

Invisibly returns TRUE on success, FALSE on failure

Note

The "brew" and "systemctl" methods restart the entire Tor daemon and should only be used as a last resort for recovery. The "signal" method is preferred but still affects all circuits on the process.

Examples

```
## Not run:
# Preferred: Use Python-side control port rotation (via run_task/asa_enumerate)
# This R function is for manual recovery only

# Send SIGHUP to Tor process (least disruptive)
rotate_tor_circuit(method = "signal")

# macOS with Homebrew (restarts daemon - use sparingly)
rotate_tor_circuit(method = "brew")

# Linux with systemd (restarts daemon - use sparingly)
rotate_tor_circuit(method = "systemctl")

## End(Not run)
```

run_task

Run a Structured Task with the Agent

Description

Executes a research task using the AI search agent with a structured prompt and returns parsed results. This is the primary function for running agent tasks.

Usage

```
run_task(
  prompt,
  output_format = "text",
  temporal = NULL,
  config = NULL,
  agent = NULL,
  expected_fields = NULL,
  thread_id = NULL,
  verbose = FALSE
)
```

Arguments

<code>prompt</code>	The task prompt or question for the agent to research
<code>output_format</code>	Expected output format. One of:
	<ul style="list-style-type: none"> • "text": Returns response text (default) • "json": Parse response as JSON • "raw": Include full trace in result for debugging • Character vector: Extract specific fields from response

<code>temporal</code>	Named list or <code>asa_temporal</code> object for temporal filtering:
	<ul style="list-style-type: none"> • <code>time_filter</code>: DuckDuckGo time filter - "d" (day), "w" (week), "m" (month), "y" (year) • <code>after</code>: ISO 8601 date (e.g., "2020-01-01") - hint for results after this date (added to prompt context) • <code>before</code>: ISO 8601 date (e.g., "2024-01-01") - hint for results before this date (added to prompt context)
<code>config</code>	An <code>asa_config</code> object for unified configuration, or NULL to use defaults
<code>agent</code>	An <code>asa_agent</code> object from initialize_agent , or NULL to use the currently initialized agent
<code>expected_fields</code>	Optional character vector of field names expected in JSON output. When provided, validates that all fields are present and non-null. The result will include a <code>parsing_status</code> field with validation details.
<code>thread_id</code>	Optional stable identifier for memory folding sessions. When provided, the same thread ID is reused so folded summaries persist across invocations. Defaults to NULL (new thread each call).
<code>verbose</code>	Print progress messages (default: FALSE)

Details

This function provides the primary interface for running research tasks. For simple text responses, use `output_format = "text"`. For structured outputs, use `output_format = "json"` or specify field names to extract. For debugging and full trace access, use `output_format = "raw"`.

When temporal filtering is specified, the search tool's time filter is temporarily set for this task and restored afterward. Date hints (after/before) are appended to the prompt to guide the agent's search behavior.

Value

An `asa_result` object with:

- `prompt`: The original prompt
- `message`: The agent's response text
- `parsed`: Parsed output (list for JSON/field extraction, NULL for text/raw)
- `raw_output`: Full agent trace (always included, verbose for "raw" format)
- `elapsed_time`: Execution time in minutes
- `status`: "success" or "error"
- `search_tier`: Which search tier was used ("primp", "selenium", etc.)
- `parsing_status`: Validation result (if `expected_fields` provided)
- `trace`: Full execution trace (for "raw" `output_format`)
- `fold_count`: Number of memory folds (for "raw" `output_format`)

See Also

Examples

```
## Not run:
# Initialize agent first
agent <- initialize_agent(backend = "openai", model = "gpt-4.1-mini")

# Simple text query
result <- run_task(
  prompt = "What is the capital of France?",
  output_format = "text",
  agent = agent
)
print(result$message)

# JSON structured output
result <- run_task(
  prompt = "Find information about Albert Einstein and return JSON with
            fields: birth_year, death_year, nationality, field_of_study",
  output_format = "json",
  agent = agent
)
print(result$parsed)

# Raw output for debugging (includes full trace in asa_result)
result <- run_task(
  prompt = "Search for information",
  output_format = "raw",
  agent = agent
)
cat(result$trace) # View full agent trace

# With temporal filtering (past year only)
result <- run_task(
  prompt = "Find recent AI research breakthroughs",
  temporal = temporal_options(time_filter = "y"),
  agent = agent
)

# With date range hint
result <- run_task(
  prompt = "Find tech companies founded recently",
  temporal = list(
    time_filter = "y",
    after = "2020-01-01",
    before = "2024-01-01"
  ),
  agent = agent
)

# Using asa_config for unified configuration
config <- asa_config(
  backend = "openai",
  model = "gpt-4.1-mini",
  temporal = temporal_options(time_filter = "y")
)
result <- run_task(prompt, config = config)
```

```
## End(Not run)
```

run_task_batch*Run Multiple Tasks in Batch***Description**

Executes multiple research tasks, optionally in parallel. Includes a circuit breaker that monitors error rates and pauses execution if errors spike, preventing cascading failures.

Usage

```
run_task_batch(
  prompts,
  output_format = "text",
  temporal = NULL,
  agent = NULL,
  parallel = FALSE,
  workers = 4L,
  progress = TRUE,
  circuit_breaker = TRUE,
  abort_on_trip = FALSE
)
```

Arguments

<code>prompts</code>	Character vector of task prompts, or a data frame with a 'prompt' column
<code>output_format</code>	Expected output format (applies to all tasks)
<code>temporal</code>	Named list for temporal filtering (applies to all tasks). See run_task for details.
<code>agent</code>	An <code>asa_agent</code> object
<code>parallel</code>	Use parallel processing
<code>workers</code>	Number of parallel workers
<code>progress</code>	Show progress messages
<code>circuit_breaker</code>	Enable circuit breaker for error rate monitoring. When enabled, tracks recent error rates and pauses if threshold exceeded. Default TRUE.
<code>abort_on_trip</code>	If TRUE, abort the batch when circuit breaker trips. If FALSE (default), wait for cooldown and continue.

Value

A list of `asa_result` objects, or if `prompts` was a data frame, the data frame with result columns added. If circuit breaker aborts, includes attribute "circuit_breaker_aborted" = TRUE.

See Also

[run_task](#), [configure_temporal](#)

Examples

```
## Not run:  
prompts <- c(  
  "What is the population of Tokyo?",  
  "What is the population of New York?",  
  "What is the population of London?"  
)  
results <- run_task_batch(prompts, agent = agent)  
  
# With temporal filtering for all tasks  
results <- run_task_batch(  
  prompts,  
  temporal = list(time_filter = "y"),  
  agent = agent  
)  
  
# Disable circuit breaker  
results <- run_task_batch(prompts, agent = agent, circuit_breaker = FALSE)  
  
# Abort on circuit breaker trip  
results <- run_task_batch(prompts, agent = agent, abort_on_trip = TRUE)  
  
## End(Not run)
```

safe_json_parse *Safe JSON Parse*

Description

Attempts to parse JSON, returning NULL on failure.

Usage

```
safe_json_parse(x)
```

Arguments

x	JSON string
---	-------------

Value

Parsed R object or NULL

<code>search_options</code>	<i>Create Search Options</i>
-----------------------------	------------------------------

Description

Creates search configuration for controlling DuckDuckGo search behavior, including rate limiting, retry policies, and result limits. These options are used by the 4-tier search fallback system.

Usage

```
search_options(
    max_results = NULL,
    timeout = NULL,
    max_retries = NULL,
    retry_delay = NULL,
    backoff_multiplier = NULL,
    inter_search_delay = NULL
)
```

Arguments

<code>max_results</code>	Maximum number of search results to return per query. Higher values provide more context but increase latency. Default: 10.
<code>timeout</code>	Timeout in seconds for individual search requests. Applies to each tier attempt separately. Default: 15.
<code>max_retries</code>	Maximum number of retry attempts when a search tier fails. After exhausting retries, the system falls back to the next tier. Default: 3.
<code>retry_delay</code>	Initial delay in seconds before the first retry. Subsequent retries use exponential backoff. Default: 2.
<code>backoff_multiplier</code>	Multiplier for exponential backoff between retries. E.g., with <code>retry_delay=2</code> and <code>multiplier=1.5</code> , delays are 2s, 3s, 4.5s. Default: 1.5.
<code>inter_search_delay</code>	Minimum delay in seconds between consecutive searches. Helps avoid rate limiting from search providers. Default: 0.5.

Details

The search system uses a 4-tier fallback architecture:

1. **PRIMP**: HTTP/2 with browser TLS fingerprint
2. **Selenium**: Headless browser for JS-rendered content
3. **DDGS**: Standard ddgs Python library
4. **Requests**: Raw POST to DuckDuckGo HTML endpoint

The retry/backoff settings apply within each tier. If all retries are exhausted, the system automatically falls back to the next tier.

Value

An object of class `asa_search`

See Also

[asa_config](#), [configure_search](#)

Examples

```
## Not run:
# Default settings
search <- search_options()

# More aggressive settings for faster searches
search <- search_options(
  max_results = 5,
  timeout = 10,
  max_retries = 2
)

# Conservative settings for rate-limited environments
search <- search_options(
  inter_search_delay = 2.0,
  max_retries = 5,
  backoff_multiplier = 2.0
)

# Use with asa_config
config <- asa_config(
  backend = "openai",
  search = search_options(max_results = 15)
)

## End(Not run)
```

summary.asa_agent *Summary Method for asa_agent Objects*

Description

Summary Method for asa_agent Objects

Usage

```
## S3 method for class 'asa_agent'
summary(object, ...)
```

Arguments

object	An asa_agent object
...	Additional arguments (ignored)

Value

Invisibly returns a summary list

summary.asa_audit_result

Summary Method for asa_audit_result Objects

Description

Summary Method for asa_audit_result Objects

Usage

```
## S3 method for class 'asa_audit_result'  
summary(object, ...)
```

Arguments

object	An asa_audit_result object
...	Additional arguments (ignored)

Value

Invisibly returns a summary list

summary.asa_enumerate_result

Summary Method for asa_enumerate_result Objects

Description

Summary Method for asa_enumerate_result Objects

Usage

```
## S3 method for class 'asa_enumerate_result'  
summary(object, ...)
```

Arguments

object	An asa_enumerate_result object
...	Additional arguments (ignored)

Value

Invisibly returns a summary list

summary.asa_response *Summary Method for asa_response Objects*

Description

Summary Method for asa_response Objects

Usage

```
## S3 method for class 'asa_response'  
summary(object, show_trace = FALSE, ...)
```

Arguments

object	An asa_response object
show_trace	Include full trace in output
...	Additional arguments (ignored)

Value

Invisibly returns a summary list

summary.asa_result *Summary Method for asa_result Objects*

Description

Summary Method for asa_result Objects

Usage

```
## S3 method for class 'asa_result'  
summary(object, ...)
```

Arguments

object	An asa_result object
...	Additional arguments (ignored)

Value

Invisibly returns a summary list

temporal_options *Create Temporal Filtering Options*

Description

Creates a temporal filtering configuration for constraining search results by date. Supports DuckDuckGo time filters, date ranges, and strict verification modes.

Usage

```
temporal_options(  
    time_filter = NULL,  
    after = NULL,  
    before = NULL,  
    strictness = "best_effort",  
    use_wayback = FALSE  
)
```

Arguments

<code>time_filter</code>	DuckDuckGo time filter: "d" (day), "w" (week), "m" (month), "y" (year), or NULL for no filter
<code>after</code>	ISO 8601 date string (e.g., "2020-01-01") - results after this date
<code>before</code>	ISO 8601 date string (e.g., "2024-01-01") - results before this date
<code>strictness</code>	Verification level: "best_effort" (default) or "strict"
<code>use_wayback</code>	Use Wayback Machine for strict pre-date guarantees

Details

Temporal filtering can operate at different levels:

- **time_filter**: DuckDuckGo native filter (fast, approximate)
- **after/before**: Date hints appended to prompts
- **strict**: Post-hoc verification of result dates
- **use_wayback**: Uses Internet Archive for guaranteed historical data

Value

An object of class `asa_temporal`

See Also

[asa_config](#), [run_task](#)

Examples

```

## Not run:
# Past year only
temporal <- temporal_options(time_filter = "y")

# Specific date range
temporal <- temporal_options(
  after = "2020-01-01",
  before = "2024-01-01"
)

# Strict historical verification
temporal <- temporal_options(
  before = "2015-01-01",
  strictness = "strict",
  use_wayback = TRUE
)

## End(Not run)

```

tor_options

Tor Options

Description

Configure shared Tor exit tracking for healthier circuit rotation.

Usage

```

tor_options(
  registry_path = NULL,
  dirty_tor_exists = ASA_TOR_REGISTRY_ENABLED,
  bad_ttl = ASA_TOR_BAD_TTL,
  good_ttl = ASA_TOR_GOOD_TTL,
  overuse_threshold = ASA_TOR_OVERUSE_THRESHOLD,
  overuse_decay = ASA_TOR_OVERUSE_DECAY,
  max_rotation_attempts = ASA_TOR_MAX_ROTATION_ATTEMPTS,
  ip_cache_ttl = ASA_TOR_IP_CACHE_TTL
)

```

Arguments

registry_path	Path to the shared SQLite registry file (default: user cache).
dirty_tor_exists	Enable the registry (tracks good/bad/overused exits).
bad_ttl	Seconds to keep a bad/tainted exit before reuse (default: 3600).
good_ttl	Seconds to treat an exit as good before refreshing (default: 1800).
overuse_threshold	Max recent uses before a good exit is considered overloaded.
overuse_decay	Window (seconds) for overuse counting before decaying.

```
max_rotation_attempts
    Max attempts to find a clean exit before giving up.
ip_cache_ttl    Seconds to cache exit IP lookups.
```

Value

An object of class `asa_tor`

truncate_string	<i>Truncate String</i>
-----------------	------------------------

Description

Truncates a string to a maximum length, adding ellipsis if truncated.

Usage

```
truncate_string(x, max_length = 100, ellipsis = "...")
```

Arguments

x	Character string
max_length	Maximum length
ellipsis	String to append when truncated

Value

Truncated string

write_csv.asa_enumerate_result	<i>Write asa_enumerate_result to CSV</i>
--------------------------------	------------------------------------------

Description

Write `asa_enumerate_result` to CSV

Usage

```
write_csv.asa_enumerate_result(x, file, include_provenance = FALSE, ...)
```

Arguments

x	An <code>asa_enumerate_result</code> object
file	Path to output CSV file
include_provenance	Include provenance as additional columns
...	Additional arguments passed to <code>write.csv</code>

Value

Invisibly returns the file path
